Field of the Invention

The invention relates to pharmaceutically-active fused heterobicyclic compounds and methods of using them to treat or prevent disorders and conditions, such as those mediated by the histamine H<sub>3</sub> receptor.

15

Background

The histamine H<sub>3</sub> receptor is located as a presynaptic autoreceptor in the central nervous system and as a presynaptic heteroreceptor on serotonergic; noradrenergic, dopaminergic, and cholinergic neurons. The histamine H<sub>3</sub> receptor is also located peripherally in tissues such as vascular smooth muscle cells.

Proposed uses of histamine H<sub>3</sub> antagonists include the treatment or prevention of dementia, Alzheimer's disease (Panula et al. *Abstr. Society Neuroscience*, 1995, 21:1977), epilepsy (Yokoyama et al. *Eur. J. Pharmacol.*, 1993, 234:129), sleep/wake disorders (Lin et al., *Br. Res.*, 1990, 523, 325; Monti et al., *Eur. J. Pharmacol.*, 1991, 205, 283) including narcolepsy, insomnia, and jet lag, eating disorders (Machidori et al. *Brain Research*, 1992, 590:180), motion sickness, vertigo, attention deficit hyperactivity disorder, learning and memory disorders (Barnes et al. *Abstr. Society Neuroscience*, 1993, 19:1813), schizophrenia (Schlicker et al. *Naunyn Schmiedeberg's Arch. Pharmacol.*, 1996, 353:325), and sequelae associated with post-ischemic reperfusion and hypertension. (Imamura et al., *J. Pharmacol. Expt. Ther.*, 1994, 271, 1259). H<sub>3</sub> antagonists are also useful to treat or prevent neurogenic

inflammation such as migraine (McLeod et al., *Abstr. Society Neuroscience*, 1996, 22, 2010), asthma (Ichinose et al., *Eur. J. Pharmacol.*, 989, 174, 49), obesity, allergic rhinitis, substance abuse, bipolar disorders, manic disorders, and depression. Histamine H<sub>3</sub> antagonists alone or in combination with a histamine H<sub>1</sub> antagonist are believed to be useful in the treatment of upper airway allergic response or allergic rhinitis (US Patent Nos. 5217986, 5352707, and 5869479).

As noted, the prior art related to histamine H<sub>3</sub> ligands was comprehensively reviewed recently ("The Histamine H<sub>3</sub> Receptor-A Target for New Drugs", Leurs, R., and Timmerman, H., (Editors), Elsevier, 1998). Within this reference the medicinal chemistry of histamine H<sub>3</sub> agonists and antagonists was reviewed (see Krause et al. and Phillips et al., respectively). Thus the importance of an imidazole moiety containing only a single substitution in the 4 position was noted together with the deleterious effects of additional substitution on activity. Particularly methylation of the imidazole ring at any of the remaining unsubstituted positions was reported to strongly decrease activity.

More recently several publications have described histamine H<sub>3</sub> ligands that do not contain an imidazole moiety. Examples include Ganellin et al *Arch. Pharm. (Weinheim, Ger.)* 1998, 331, 395; Walczynski et al *Arch. Pharm. (Weinheim, Ger.)* 1999, 332, 389; Walczynski et al *Farmaco* 1999, 684; Linney et al *J. Med. Chem.* 2000, 2362; U.S. Patent 5,352,707; PCT Application WO99/42458, published August 26, 1999; and European Patent Application 0978512, published on February 9, 2000.

The context will indicate that the substituent is an alkylene or hydrocarbon radical with at least two hydrogen atoms removed (bivalent) or more hydrogen atoms removed (multivalent). An example of a bivalent radical linking two parts of the molecule is W in formula (I)(B) which links Z with the phenyl group (-Ph-WZ). Subject to the claims, W can be an alkyl (strictly, alkylene) group (-Ph-CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>-Z), an aminoalkyl group (-Ph-NH-CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>-Z), an alkoxy group (-Ph-O-CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>-Z), an "oxa" (-Ph-O-Z), and so on.

15

20

Second, radicals or structure fragments as defined herein are understood to include substituted radicals or structure fragments. Using "alkyl" as an example, "alkyl" should be understood to include substituted alkyl having one or more substitutions, such as between 1 and 5, 1 and 3, or 2 and 4 substituents. The substituents may be the same (dihydroxy, dimethyl), similar (chlorofluoro), or different (chlorobenzyl- or aminomethyl-substituted). Examples of substituted alkyl include haloalkyl (such as fluoromethyl, chloromethyl, difluoromethyl, perchloromethyl, 2-bromoethyl, and 3-iodocyclopentyl), hydroxyalkyl, aminoalkyl, nitroalkyl, alkylalkyl, and so on.

from 2 to 5, and compounds of formula (IV) in which the above definitions apply, and  $R_{13}$  is  $C_{1-6}$  alkyl are described in Scheme 9.

Scheme 9

- 5     Specifically, a compound of formula (XVI) in which  $R_{13}$  is H, or  $C_{1-6}$  alkyl, and  $R_a$ -Re is as previously described, is treated with a base such as NaH or  $K_2CO_3$ , and a compound of formula (XVIII), in which  $X_6$  is selected from Cl, Br, I,  $-OSO_2CH_3$ ,  $-OTs$ , or OTf, and  $X_7$  is selected from the same definition as  $X_6$  but less reactive than the element chosen for  $X_6$ , and n is an integer from 2 to 10, in a solvent such as THF, DMF or DMSO, to yield the corresponding compound of formula (XVII). The compound of formula (XVII) is then treated with a compound of formula (XIX), wherein  $R_{11}$  and  $R_{12}$  are as defined in Claim (1), in a solvent such as DMF or DCM, to afford the corresponding compound of formula (VI).
- 15    Compounds of formula (III) are prepared by treatment of corresponding compounds of formula (IV), in which  $R_{13}$  is defined as H, with a base such as LDA or LiHMDS, and TMSCHN<sub>2</sub>, in a solvent such as THF, diethylether, or the like. Alternately, compounds of formula (III) can also be prepared by treating corresponding compounds of formula (IV), with a base such as  $K_2CO_3$  or KOH, 20 and a phosphonate such as  $(CH_3O)_2P(O)C(N_2)C(O)CH_3$ , in a solvent such as MeOH.

Compounds of formula (Ig) can be obtained using the methods described in Scheme 10.

Scheme 10

5 Specifically a compound of formula (VI) as defined in scheme 9 is treated with an aryl hydrazine of formula (VII), wherein  $\text{R}_5\text{-R}_8$  is as defined as in claim (1), in polyphosphoric acid, to yield the corresponding compound of formula (Ig).

10 Additionally compounds of formula (I) can be formed using the procedures outlined in Scheme 11.

Scheme 11

15 Specifically a compound of formula (II), as defined in Scheme 2 is combined with a compound of formula (III) as defined in Scheme 9, in the presence of a palladium catalyst such as  $\text{Pd}(\text{PPh}_3)_2\text{Cl}_2$  or  $\text{Pd}(\text{OAc})_2$ , and a copper source such as  $\text{CuI}$ ,  $\text{CuOAc}$  or  $\text{CuBr}$ , and a base such as triethylamine or pyridine, in a solvent such as THF or DMF, to provide the corresponding compounds of formula (Ih).

According to the invention, the disclosed compounds and compositions are useful for the amelioration of symptoms associated with, the treatment of, and/or the prevention of, the following conditions and diseases, or symptoms associated with them: dementia, Alzheimer's disease, narcolepsy, eating disorders, motion sickness, vertigo, attention deficit hyperactivity disorder,

learning and memory disorders, schizophrenia, mild cognitive impairment upper airway allergic response (allergic rhinitis), insomnia, jet lag, obesity, asthma, neurogenic inflammation, substance abuse, bipolar disorders, manic disorders, and depression. The invention also features pharmaceutical compositions, which include, without limitation, one or more of the disclosed compounds, and a pharmaceutically acceptable carrier or excipient.

5           1.     Dosages

Those skilled in the art will be able to determine, according to known methods, the appropriate dosage for a patient, taking into account factors such 10 as age, weight, general health, the type of symptoms requiring treatment, and the use of other medications. An effective amount means that amount of pharmaceutical reagent (such as a prodrug, metabolic precursor, or active compound) that elicits the biological or medical response desired. In general, a therapeutically effective amount will be between 0.01 and 1000 mg/kg per day, preferably between 0.01 and 250 mg/kg body weight, and daily dosages will be 15 between 0.50 and 5000 mg for an adult subject of normal weight. Capsules, tablets or other formulations (such as liquids and film-coated tablets) may be of between 0.20 and 100 mg, such as 0.20, 0.50, 1.0, 2.0, 3.0, and 10 mg and can be administered according to the disclosed methods.

20           2.     Formulations

Dosage unit forms include tablets, capsules, pills, powders, granules, aqueous and nonaqueous oral solutions and suspensions, and parenteral solutions packaged in containers adapted for subdivision into individual doses. Dosage unit forms can also be adapted for various methods of administration, 25 including controlled release formulations, such as subcutaneous implants. Administration methods include oral, rectal, parenteral (intravenous, intramuscular, subcutaneous), intracisternal, intravaginal, intraperitoneal, intravesical, local (drops, powders, ointments, gels or cream), and by inhalation (a buccal or nasal spray) as appropriate depending on the overall health and 30 condition of the patient as determined by a physician or veterinary doctor.

Parenteral formulations include pharmaceutically acceptable aqueous or nonaqueous solutions, dispersion, suspensions, emulsions, and sterile powders for the preparation thereof. Examples of carriers include water,

ethanol, polyols (propylene glycol, polyethylene glycol), vegetable oils, and injectable organic esters such as ethyl oleate. Fluidity can be maintained by the use of a coating such as lecithin, a surfactant, or maintaining appropriate particle size. Carriers for solid dosage forms include (a) fillers or extenders, (b) 5 binders, (c) humectants, (d) disintegrating agents, (e) solution retarders, (f) absorption accelerators, (g) adsorbants, (h) lubricants, (i) buffering agents, and (j) propellants.

Compositions may also contain adjuvants such as preserving, wetting, emulsifying, and dispensing agents; antimicrobial agents such as parabens, 10 chlorobutanol, phenol, and sorbic acid; isotonic agents such as a sugar or sodium chloride; absorption-prolonging agents such as aluminum monostearate and gelatin; and absorption-enhancing agents.

### 3. Combination Therapy

The present invention also provides compositions and methods useful 15 for the treatment of disorders or conditions modulated, preferably antagonized, by the histamine H<sub>3</sub> receptor in combination with compounds that modulate other receptors including, but not limited to, histamine H<sub>1</sub> and histamine H<sub>2</sub> receptors. The present invention includes compounds and compositions useful 20 in methods of combination therapy for the treatment of diseases or conditions modulated by the histamine H<sub>3</sub> receptor in combination with compounds that are selective serotonin re-uptake inhibitors (SSRIs), such as PROZAC™, or are selective norepinephrine uptake inhibitors. Such combination methods include (a) administering the two or more pharmaceutical agents separately 25 formulated and at separate times, and (b) administering the two or more agents simultaneously in a single formulation or in separate formulations administered more or less at the same time. For example, one aspect is a method of treatment comprising administering at least one histamine H<sub>3</sub> receptor modulating compound disclosed herein and administering at least one 30 compound selected from a histamine H<sub>1</sub> receptor modulating compound, a histamine H<sub>2</sub> receptor modulating compound, a selective serotonin reuptake inhibitor (such as PROZAC™), or a selective norepinephrine uptake inhibiting compound.

#### 4. Related Compounds

The invention provides the disclosed compounds and closely related, pharmaceutically acceptable forms of the disclosed compounds, such as salts, 5 esters, amides, acids, hydrates or solvated forms thereof; masked or protected forms; and racemic mixtures, or enantiomerically or optically pure forms.

Pharmaceutically acceptable salts, esters, and amides include carboxylate salts (e.g., C<sub>1-8</sub> alkyl, cycloalkyl, aryl, heteroaryl, or non-aromatic heterocyclic) amino acid addition salts, esters, and amides which are within a 10 reasonable benefit/risk ratio, pharmacologically effective and suitable for contact with the tissues of patients without undue toxicity, irritation, or allergic response. Representative salts include hydrobromide, hydrochloride, sulfate, bisulfate, nitrate, acetate, oxalate, valerate, oleate, palmitate, stearate, laurate, borate, benzoate, lactate, phosphate, tosylate, citrate, maleate, fumarate, succinate, tartrate, naphthylate, mesylate, glucoheptonate, lactobionate, and laurylsulfonate. These may include alkali metal and alkali earth cations such 15 as sodium, potassium, calcium, and magnesium, as well as non-toxic ammonium, quaternary ammonium, and amine cations such as tetramethyl ammonium, methylamine, trimethylamine, and ethylamine. See example, S.M. 20 Berge, et al., "Pharmaceutical Salts," J. Pharm. Sci., 1977, 66:1-19 which is incorporated herein by reference. Representative pharmaceutically acceptable amides of the invention include those derived from ammonia, primary C<sub>1-6</sub> alkyl amines and secondary di (C<sub>1-6</sub> alkyl) amines. Secondary amines include 5- or 6-membered heterocyclic or heteroaromatic ring moieties containing at least 25 one nitrogen atom and optionally between 1 and 2 additional heteroatoms. Preferred amides are derived from ammonia, C<sub>1-3</sub> alkyl primary amines, and di (C<sub>1-2</sub> alkyl)amines. Representative pharmaceutically acceptable esters of the invention include C<sub>1-7</sub> alkyl, C<sub>5-7</sub> cycloalkyl, phenyl, and phenyl(C<sub>1-6</sub>)alkyl esters. Preferred esters include methyl esters.

30 The invention also includes disclosed compounds having one or more functional groups (e.g., hydroxyl, amino, or carboxyl) masked by a protecting group. See, e.g., Greene and Wuts, Protective Groups in Organic Synthesis, 3<sup>rd</sup> ed., (1999) John Wiley & Sons, NY. Some of these masked or protected

compounds are pharmaceutically acceptable; others will be useful as intermediates. Synthetic intermediates and processes disclosed herein, and minor modifications thereof, are also within the scope of the invention.

## 10 Step A Preparation of 2-iodo-N-(methanesulfonyl)aniline

Methanesulfonyl chloride (4.4 mL, 57 mmol) was added to a 0°C dichloromethane (200 mL) solution containing 2-iodoaniline (5.0 g, 23 mmol) and triethylamine (9.6 mL, 69 mmol). The resulting mixture was stirred for 90 minutes, washed with HCl (0.5 M). The organics were separated then dried over sodium sulfate and concentrated in vacuo. The residue was then treated with potassium hydroxide (2.0 M in 1:1 methanol:water, 75 mL) for 30 min. This material was then diluted with dichloromethane and washed with HCl (1.0 N, 300 mL). The organics were separated then dried over sodium sulfate and concentrated to provide the title compound (5.15 g) as a tan solid.

## Step B Preparation of 4-(methoxyethoxymethyl)benzaldehyde

Sodium hydride (2.4g (60%), 60 mmol) was added to 4-hydroxybenzaldehyde (6.0 g, 50 mmol) in N, N-dimethylformamide (100 mL). The suspension was stirred for 1 hour and then treated with 2-methoxyethoxymethyl chloride (6.8 mL, 60 mmol), and allowed to stir an additional 16 hours. The reaction was then partitioned between water and ether:ethyl acetate (1:1). The organics were then washed with water (4x), dried (potassium carbonate), and concentrated. The crude materials were then purified by silica gel chromatography (hexanes:ethyl acetate) to afford the title compound (9.0 g)

## Step C Preparation of 1-ethynyl-4-(methoxyethoxymethyl)benzene

Dimethyl[(2-diazo-3-oxo)propyl] phosphonate was added in 4 portions to a suspension of potassium carbonate (4.96 g, 36 mmol), the product of Step B (3.78 g, 18 mmol), and methanol (50 mL). The reaction was stirred for 16 hours, and concentrated in vacuo. The residue was taken up in ether, washed with water (3x), dried (potassium carbonate), and concentrated. The crude product was purified by silica gel chromatography (hexane:ethyl acetate) to provide the title compound (2.3 g).

Step D Preparation of 2-(4-(methoxyethoxymethyl)phenyl)-1-

The products of Step A (3.0 g, 10 mmol) and step C (2.2 g, 10 mmol) were combined in N, N-dimethylformamide (20 mL) and triethylamine (5 mL). The solution was then treated with dichlorobis(triphenylphosphine)palladium(II) (0.7 g, 1.0 mmol); copper(I)iodide (380 mg, 2.0 mmol), and stirred at 80 °C for 17 hours. The reaction was then diluted with ether:ethyl acetate (1:1, 200 mL), washed with water (5x), dried (potassium carbonate), and concentrated in vacuo. ## F. Biological Examples

### Biological Example 1

#### 1(A) Transfection of cells with human histamine receptor

5 A 10 cm tissue culture dish with a confluent monolayer of SK-N-MC cells was split two days prior to transfection. Using sterile technique the media was removed and the cells were detached from the dish by the addition of trypsin. One fifth of the cells were then placed onto a new 10 cm dish. Cells were grown in a 37°C incubator with 5% CO<sub>2</sub> in Minimal Essential Media Eagle with  
10 10% Fetal Bovine Serum. After two days cells were approximately 80% confluent. These were removed from the dish with trypsin and pelleted in a clinical centrifuge. The pellet was then re-suspended in 400 µL complete media and transferred to an electroporation cuvette with a 0.4cm gap between the electrodes (Bio-Rad #165-2088). One µg supercoiled H<sub>3</sub>receptor cDNA  
15 was added to the cells and mixed. The voltage for the electroporation was set at 0.25 KV, the capacitance is set at 960 µF.

After electroporation the cells were diluted into 10 mL complete media and plated onto four 10cm dishes. Due to the variability in the efficiency of electroporation, four different concentrations of cells were plated. The ratios used were: 1:20, 1:10, and 1:5, with the remainder of the cells being added to the fourth dish. The cells were allowed to recover for 24 hours before adding the selection media (complete media with 600 µg/ml G418). After 10 days dishes were analyzed for surviving colonies of cells. Dishes with well-isolated colonies were used. Cells from individual colonies were isolated and tested.  
20 25 SK-N-MC cells were used because they give efficient coupling for inhibition of adenylate cyclase. The clones that gave the most robust inhibition of adenylate cyclase in response to histamine were used for further study.

#### 1(B) [3H]-N-methylhistamine binding

30 Cell pellets from histamine H<sub>3</sub> receptor-expressing SK-N-MC cells were homogenized in 20 mM TrisHCl/0.5mM EDTA. Supernatants from a 800 g spin were collected, reccentrifuged at 30,000 g for 30 minutes. Pellets were rehomogenized in 50 mM Tris/5mM EDTA (pH 7.4). Membranes were

incubated with 0.8 nM [<sup>3</sup>H]-N-methylhistamine plus/minus test compounds for 45 minutes at 25°C and harvested by rapid filtration over GF/C glass fiber filters (pretreated with 0.3% polyethylenimine) followed by four washes with ice cold buffer. Filters were dried, added to 4 mL scintillation cocktail and then 5 counted on a liquid scintillation counter. Non-specific binding was defined with 10 µM histamine.  $K_I$  values were calculated based on a  $K_D$  of 800 pM and a ligand concentration ([L]) of 800 pM according to the formula:

$$K_I = (IC_{50}) / (1 + ([L] / (K_D)))$$
